

Steps to Deploy a Project on Netlify

1. Prepare Your Project:

Make sure your project is complete, and all files are working as expected. Typically, you should have an 'index.html' file as the entry point.

2. Push Your Code to Git Repository (Optional):

Upload your project to GitHub, GitLab, or Bitbucket if you want to deploy via a Git provider.

3. Create a Netlify Account:

Visit <https://www.netlify.com/> and sign up for a free account or log in if you already have one.

4. Start a New Site:

After logging in, click on 'Add new site' and choose either 'Import an existing project' from Git or 'Deploy manually' by uploading your folder.

5. Deploy via Git:

If using Git, connect your repository, select the branch, and set the build command and publish directory (e.g., 'npm run build' and 'dist' for React/Vue).

6. Deploy via Manual Upload:

If uploading manually, drag and drop your project folder (with index.html) into the upload area.

7. Wait for Deployment:

Netlify will build and deploy your project. It usually takes a few seconds to a minute.

8. Visit Your Site:

Once deployed, Netlify will provide a temporary URL (e.g., mystunning-site.netlify.app). You can customize this under Site Settings.

9. Set Up Custom Domain (Optional):

You can connect your own domain to the Netlify site through the 'Domain management' section.

10. Continuous Deployment (Optional):

If connected to a Git repository, any new push to the selected branch will trigger a new deployment automatically.
